

Approximate sizing for Riedell speed boots

For men's and women's boots made on the original "248" last (122, 125, 195, 595 and 695) measure on the Riedell stick (standing) and then add ½ size. This should be approximately the same as normal street shoe size for men and one full size smaller than normal street shoe size for women.

For boots made on the "395" last (265, 395, 811, 911, 951, 126, 965, and 1065) the size on the Riedell stick should be fairly close to correct. This should be approximately ½ size smaller than normal street shoe size for men and 1 ½ smaller than street shoe size for women. The models 265, 126, 965 and 1065 are made with a medium ball and a narrow heel.

The "395" last is the same as the original "248" last except it has more height in the toe box. This allows the foot to fit a little closer to the end of the boot and is why boots made on the "395" sometimes feel bigger.

The shape of the toes and the width of the foot also effect sizing greatly. A foot with a "square" toe shape will need more room at the end of the boot than a narrow foot or a foot with a more pointed toe shape.

When ordering any "special make up" boot in different colors or special widths, it is always advisable to first try on a stock boot to make sure the sizing is correct. Special order boots are not returnable.
